Description			
<p>Ok, I just got orFox set up on my new tablet(downloaded from Play Store.. I suppose I ought to try F-Droid). I was HOPING to add uBlock Origin (since ABP is slowly going downhill), Disconnect and Privacy Badger. However, when I went in to the add-ons, the only add-on listed is NoScript. I tried to add HTTPSanywhere from mozilla, but in orFox the link won't come up right, even after I disabled NoScript. I managed to copy and paste it, but then orFox blocked it, no way to allow it. So then I found the repo page, tried to add it from there, but it just downloaded it and won't add it from the download folder, as far as I can tell. ..didn't try to drag and drop it, but i'm not sure if any of the file managers will even support that, or if Firefox for Android supports it.</p> <p>Anyway.. Can you help me with the issue of getting HTTPSanywhere or any of the other add-ons into orFox?</p>

Didn't intend to post that anonymous. Anyway, apparently ONE of my methods worked to install HTTPSanywhere, or it was glitched somehow. When I went in to the menu right after posting the above, it was listed in the menu. Then when I refreshed the add-on list, it appeared. Is there even the remotest possibility my Firefox install with HTTPSanywhere might be doing something weird if I have them both open? At any rate, I can't explain it. I'd still like to know if it's possible to install the other add-ons though. :)
